Section 1: Ground support selection and design considerations

CHAPTER 1: Introduction

- 1.1 The principal objective of ground support
- 1.2 Ground conditions
 - 1.2.1 Normal conditions
 - 1.2.2 High-stress conditions
 - 1.2.3 Large deformations

CHAPTER 2: Rock mass behaviour and failure mechanisms

- 2.1 Introduction
- 2.2 Loading and failure mechanisms
 - 2.2.1 Gravity failures driven by stress relaxation
 - 2.2.2 Failures driven by compressive stress
 - 2.2.2.1 Progressive or brittle failure (stiff loading)
 - 2.2.2.2 Sudden and violent failure (soft loading)
- 2.3 Summary of typical failure mechanisms in underground mines
- 2.4 Stress path

CHAPTER 3: Rock reinforcement behaviour, anchoring mechanisms and specifications

- 3.1 Introduction
- 3.2 Rock reinforcement behaviour
 - 3.2.1 Strong versus weak rock reinforcement
 - 3.2.2 Stiff versus soft reinforcement elements
 - 3.2.3 Post-peak behaviour: brittle versus ductile
 - 3.2.4 Low versus high energy absorption rock reinforcement

- 3.2.5 Rock reinforcement and rock mass behaviour
- 3.3 Point anchor bolts
- 3.4 Continuous anchor bolts
 - 3.4.1 Continuous chemically bonded anchor bolts
 - 3.4.1.1 Resin anchor bolts
 - 3.4.1.2 Cement grouted continuous anchor bolts
 - 3.4.2 Continuous friction bond anchor bolts
 - 3.4.2.1 Friction rock stabilisers
 - 3.4.2.2 Expandable bolts
- 3.5 High energy absorbing or yielding bolts
 - 3.5.1 Debonded yielding reinforcement
 - 3.5.2 Chemically bonded yielding anchors
 - 3.5.3 Expandable bolt with a debonded point anchor
 - 3.5.4 Hybrid bolts
 - 3.5.5 Self-drilling bolts
- 3.6 Cable bolts
 - 3.6.1 Prestressed cable bolts
 - 3.6.2 Resin grouted cable bolts
 - 3.6.3 Debonded cable bolts
- 3.7 Surface fixtures
 - 3.7.1 Rockbolt and plate interaction
 - 3.7.2 Debonded cable bolts

CHAPTER 4: Surface support behaviour

- 4.1 Introduction
- 4.2 Mesh
 - 4.2.1 Welded wire mesh
 - 4.2.1.1 Weldmesh behaviour
 - 4.2.2 Chainlink mesh
 - 4.2.2.1 Chainlink mesh behaviour
- 4.3 Straps
 - 4.3.1 Steel straps
 - 4.3.2 Mesh straps
 - 4.3.3 Osro straps
 - 4.3.4 Cable (or rope) lacing
- 4.4 Shotcrete
 - 4.4.1 Basic components of shotcrete

- 4.4.1.1 Cement
- 4.4.1.2 Aggregates
- 4.4.1.3 Admixtures
- 4.4.1.4 Cementitious products
- 4.4.2 Shotcrete reinforcement
 - 4.4.2.1 Mesh reinforced shotcrete
 - 4.4.2.2 Fibre reinforced shotcrete
- 4.4.3 Shotcrete thickness
- 4.4.4 Shotcrete stabilisation mechanisms
- 4.4.5 Reinforced shotcrete arches
- 4.4.6 Shotcrete pillars
- 4.4.7 Thin spray-on liners

2

Section 2: Data required for ground support design

CHAPTER 5: Rock mass data

- 5.1 Introduction
- 5.2 Rock mass characterisation
- 5.3 Data collection
- 5.4 Exploration and geotechnical boreholes
- 5.5 Core drilling and logging
 - 5.5.1 Total core recovery
 - 5.5.2 Fracture frequency
 - 5.5.3 Rock quality designation
 - 5.5.4 Structure orientation from core
- 5.6 Mechanical properties of intact rock
 - 5.6.1 Uniaxial compressive strength
 - 5.6.2 Triaxial compressive strength
 - 5.6.3 Tensile strength
 - 5.6.4 Field estimates and index tests for intact rock
 - 5.6.4.1 Schmidt hammer
 - 5.6.4.2 Point load strength test
- 5.7 Mechanical properties of discontinuities
- 5.8 Structural mapping
 - 5.8.1 Digital characterisation

5.9 Rock mass classifications

5.9.1 Rock Mass Rating system

5.9.2 Q-system

5.9.3 The mining or modified RMR (MRMR)

5.9.4 Geological Strength Index

5.10 Practical considerations in data collection for rock mass classification

5.10.1 Core logging for rock mass classification purposes

5.10.2 Surface exposure mapping for rock mass classification purposes

5.11 Interpretation and use of rock mass classifications

5.11.1 Rock mass classification as a design tool

5.11.2 Personnel

5.11.3 Scale

5.11.4 Reality check

5.11.5 Statistical correlations between rock mass classification systems

5.12 Large-scale rock mass properties

5.12.1 Modulus of elasticity

5.12.2 Estimating the strength of rock masses

5.13 Concluding remarks

CHAPTER 6: Rock stress data

6.1 Introduction

6.2 Pre-mining stress regime and trends

6.2.1 Global stress regime trends

6.2.2 Stress regimes and trends in Canada

6.2.3 Stress regimes and trends in Australia

6.3 Techniques for assessing in situ stress

6.3.1 Overcoring

6.3.1.1 CSIRO HI Cell

6.3.1.2 The modified doorstopper

6.3.2 Stress memory techniques from core

6.3.3 Core discing

6.3.4 Borehole breakout method

6.4 Presentation and interpretation of stress measurement results

6.5 Understanding the stress at a mine site

6.6 The Final Rock Stress Model methodology

6.7 Monitoring of stress change

6.8 Concluding remarks

CHAPTER 7: Ground support performance data

- 7.1 Introduction
- 7.2 Data for ground support subjected to static load
 - 7.2.1 Laboratory static tests on reinforcement elements
 - 7.2.2 In situ pull tests on rock reinforcement
 - 7.2.2.1 Friction rock stabiliser tests
 - 7.2.2.2 Grouted and expandable bolt tests
 - 7.2.2.3 Indicative working capacity of rockbolts
- 7.3 Static tests on surface support
 - 7.3.1 Static tests on mesh
 - 7.3.2 Static tests on shotcrete
- 7.4 Data for ground support subjected to dynamic loading
 - 7.4.1 Dynamic capacity of ground support estimated from drop tests
 - 7.4.2 Compilation of published results from drop testing
 - 7.4.2.1 Reinforcement results
 - 7.4.2.2 Surface support results
 - 7.4.3 Dynamic system testing
 - 7.4.4 In situ dynamic drop tests
 - 7.4.5 Dynamic capacity of ground support estimated from simulated rockbursts
- 7.5 Concluding remarks

CHAPTER 8: Geomechanical data confidence and reliability

- 8.1 Introduction
- 8.2 Organising datasets into models
- 8.3 Geomechanical model confidence
 - 8.3.1 Constructing geotechnical models
- 8.4 Statistical approaches to geomechanical data sampling
- 8.5 Structural data
- 8.6 Laboratory data
- 8.7 Practical implications

3

Section 3: Ground support design methods

CHAPTER 9: Analytical ground support design methods

- 9.1 Introduction

- 9.2 Role of reinforcement and surface support
- 9.3 Reinforcement design
 - 9.3.1 Closed form solutions
 - 9.3.2 Convergence confinement or ground reaction curve method
 - 9.3.3 Stress-induced buckling
 - 9.3.4 Structural or limit equilibrium design
 - 9.3.4.1 The beam concept for bedded rock
 - 9.3.4.2 Rock reinforcement unit (RRU)
 - 9.3.4.3 Reinforcement guidelines based on the rock arch concept
 - 9.3.4.4 The parabolic arch concept
 - 9.3.4.5 Two-dimensional wedge analysis
 - 9.3.4.6 Three-dimensional wedge analysis
 - 9.3.5 Discrete fracture network based reinforcement analysis
- 9.4 Surface support
 - 9.4.1 Design of mesh
 - 9.4.2 Design of shotcrete
 - 9.4.2.1 Shotcrete failure mechanisms
 - 9.4.2.2 Two-dimensional wedge analysis for shotcrete support
 - 9.4.2.3 Three-dimensional wedge analysis for shotcrete support
- 9.5 Concluding remarks

CHAPTER 10: Empirical ground support design methods

- 10.1 Introduction
- 10.2 Empirical ground support design based on rock mass classification
 - 10.2.1 Support pressure
 - 10.2.2 Support recommendations based on RMR and MRMR
 - 10.2.3 Ground support recommendations based on the Q-system
 - 10.2.4 Issues related to the implementation of the Grimstad and Barton chart in mining
- 10.3 New empirical ground support design guidelines for mining drives
 - 10.3.1 Scope of the new guidelines
 - 10.3.2 Methodology
 - 10.3.3 Ground support design guidelines for mining drives
 - 10.3.4 The limitations of the ground support guidelines
- 10.4 Concluding remarks

CHAPTER 11: Numerical modelling for ground support design – mining applications

- 11.1 Introduction

- 11.2 Two-dimensional numerical analysis of tunnels
- 11.3 Instability zone approach
 - 11.3.1 Analysis based on elastic modelling
 - 11.3.2 Analysis based on elasto-plastic modelling
- 11.4 Comparative approach
- 11.5 Explicit modelling of ground support approach
 - 11.5.1 Design specification
 - 11.5.2 Rehabilitation scheduling
- 11.6 Inputs and sensitivity
 - 11.6.1 Rock mass strength and deformability
 - 11.6.2 Discontinuity strength and deformability
 - 11.6.3 Ground support strength and deformability
 - 11.6.4 Sources of inherent variability
 - 11.6.4.1 Actual versus design excavation geometry
 - 11.6.4.2 Joint network geometry
 - 11.6.5 Mesh dependence
- 11.7 Discontinuum models
 - 11.7.1 Explicit representation of ground support in discontinuum models
 - 11.7.2 Continuous versus discontinuous models
- 11.8 Confidence in numerical modelling results
 - 11.8.1 Code verification
 - 11.8.2 Model calibration and validation
- 11.9 Discussion

4

Section 4: Extreme ground conditions

CHAPTER 12: Ground support in squeezing ground

- 12.1 Introduction
- 12.2 Squeezing mechanisms
- 12.3 Complete shear failure
 - 12.3.1 Empirical approaches for complete shear failure mechanism
 - 12.3.2 Numerical modelling of squeezing in civil engineering tunnels
- 12.4 Buckling failure mechanism: squeezing in foliated ground
 - 12.4.1 Observations of buckling mechanism in underground mines
 - 12.4.2 The hard rock squeezing index

- 12.4.3 Forecasting convergence in foliated squeezing ground
- 12.4.4 Numerical modelling of buckling failure mechanism in foliated squeezing ground
- 12.4.5 Explicit modelling of reinforcement in squeezing ground
- 12.5 Context for ground support application in civil and mining squeezing ground
- 12.6 General approaches to manage squeezing ground in mines
 - 12.6.1 Support system concepts
 - 12.6.2 Containing the excavation surface
 - 12.6.3 Reinforcing squeezing ground
 - 12.6.4 Ground support coverage
 - 12.6.5 Connection between surface support and reinforcement
 - 12.6.6 Deep anchoring of the reinforced shell
 - 12.6.7 Rehabilitation
 - 12.6.8 Umbrella arch method
 - 12.6.9 Other ground support approaches in very weak and squeezing ground conditions
- 12.7 Summary

CHAPTER 13: Ground support design for rockburst prone conditions

- 13.1 Background
- 13.2 Ground support subjected to dynamic loading – a case of design indeterminacy
 - 13.2.1 Scale–distance relationship and dynamic demand expressed as ppv
 - 13.2.2 Radiation pattern
 - 13.2.3 Reflection and refraction of the stress wave
 - 13.2.4 The site effect
 - 13.2.5 Effect of rock brittleness
- 13.3 Seismic events and rockburst damage mechanisms and demand on ground support
- 13.4 Dynamic capacity of ground support systems
 - 13.4.1 The weakest link
 - 13.4.2 Challenges in using drop test results for dynamic ground support system design
- 13.5 Dynamic ground support design
 - 13.5.1 The Canadian Rockburst Handbook (CRH) approach
 - 13.5.1.1 Static loading demand calculation
 - 13.5.1.2 Displacement demand estimation
 - 13.5.1.3 Dynamic displacement demand
 - 13.5.1.4 Dynamic load or kinetic energy demand estimation
 - 13.5.1.5 Typical ground support capacity estimation
 - 13.5.1.6 Ground support capacity estimation
 - 13.5.2 The rockburst damage potential approach

- 13.5.2.1 Static stress condition factor E1
- 13.5.2.2 Ground support capacity factor E2
- 13.5.2.3 Excavation span factor E3
- 13.5.2.4 Geological structure factor E4
- 13.5.2.5 Rockburst damage scale (RDS) and rockburst damage potential (RDP) graph
- 13.5.2.6 Rockburst damage potential used as a design and risk management tool
- 13.5.2.7 LaRonde modified rockburst damage potential
- 13.5.3 The Western Australian School of Mines (WASM) approach
- 13.5.4 Empirical charting
 - 13.5.4.1 Acceptable (S0 to S2 – SC0 to SC2)
 - 13.5.4.2 Tolerable (S3 – SC3)
 - 13.5.4.3 Intolerable (S4 to S5 – SC4 to SC5)
- 13.5.5 Passive monitoring
- 13.6 Evolution of ground support selection for rockburst conditions
 - 13.6.1 Strategy change at Creighton, Copper Cliff and Coleman mines
 - 13.6.2 Kidd mine ground support adjustments
 - 13.6.3 Example from other Canadian mines
- 13.7 Discussion

CHAPTER 14: Long-term performance of ground support – corrosion

- 14.1 Introduction
- 14.2 Fundamentals of corrosion
 - 14.2.1 Corrosion environments
 - 14.2.2 Forms of corrosion
- 14.3 Ground support corrosion
 - 14.3.1 Corrosion rates
 - 14.3.2 General corrosion investigations using coupons
 - 14.3.3 Friction rock stabilisers
 - 14.3.4 Expandable bolts
 - 14.3.5 Rebar
 - 14.3.6 Cable bolting
 - 14.3.7 Mesh
- 14.4 Mitigation of corrosion effects
 - 14.4.1 Selection of ground support type
 - 14.4.2 Material selection of ground support
 - 14.4.3 Protective coatings
 - 14.4.4 Installation practice

- 14.5 Characterising and monitoring the performance of ground support to corrosion
 - 14.5.1 Characterisation of the environment
 - 14.5.2 Visual monitoring of corroded support
 - 14.5.3 Use of a borehole camera probe
 - 14.5.4 Pull tests
 - 14.5.5 Overcoring
 - 14.5.6 Mesh
 - 14.5.7 Fracture analysis
- 14.6 Rehabilitation guidelines
- 14.7 Summary

5

Section 5: Probabilistic approach to ground support design

CHAPTER 15: Probability, risk and design

- 15.1 Design acceptance criteria
 - 15.1.1 Factor of safety as an acceptance criterion
 - 15.1.2 Probability of failure as a design acceptance criterion
 - 15.1.3 Risk as a design acceptance criterion
 - 15.1.4 Factor of safety, probability of failure, and risk in the design process
- 15.2 Important concepts related to probabilistic and risk-based design
 - 15.2.1 Statistical and probabilistic analyses
 - 15.2.2 State of mind or state of nature
 - 15.2.3 Frequency of occurrence and degree of belief
 - 15.2.4 Uncertainty and variability
 - 15.2.5 Correlations between factor of safety and probability of failure
 - 15.2.6 Voluntary and involuntary risk
 - 15.2.7 Corporate and individual risk
 - 15.2.8 Evaluating total risk
 - 15.2.9 Accuracy of risk assessment
- 15.3 Design acceptance levels
 - 15.3.1 Economic risk
 - 15.3.2 Safety risk
- 15.4 Safety risk acceptance levels
 - 15.4.1 Accepted individual safety risk
 - 15.4.2 Accepted societal safety risk

15.4.3 Concluding remarks

CHAPTER 16: A Risk-based approach to ground support design

16.1 Introduction

16.1.1 Risk-based ground support design in mining context

16.2 Probabilistic stress damage analysis

16.2.1 Input data

16.2.2 Elastic superposition

16.2.3 Elasto-plastic analysis

16.2.4 Damage risk model (frequency and extent)

16.3 Probabilistic analysis of structurally defined failures

16.3.1 Input data

16.3.2 Ground support system

16.3.3 Analysis of structurally defined failures

16.3.4 Rockfall cumulative probability distributions

16.4 Economic risk evaluation

16.5 Safety risk evaluation

16.5.1 The safety risk model

16.5.2 Failure probability

16.5.3 Individual safety risk

16.5.3.1 Temporal coincidence

16.5.3.2 Spatial coincidence

16.5.3.3 Personnel failure coincidence for an individual

16.5.3.4 Exposure mitigation

16.5.3.5 Assessment of individual safety risk

16.5.4 Societal safety risk

16.5.4.1 Temporal and spatial coincidence

16.5.4.2 Exposure mitigation

16.5.4.3 Assessment of societal risk

16.5.4.4 Application of the safety risk model

16.6 Concluding remarks

Appendices

APPENDIX 1: Rock mass ratings

APPENDIX 2: Q-system

APPENDIX 3: Techniques for probabilistic and risk calculations
